

Integration Nganluong.vn into the website of digital goods

1. Payment solution for digital goods in web environment

By using payment solution of Nganluong.vn, with some clicks a customer (a buyer) can easily pay for their product without moving among applications or checkout sites. Example: customer is reading book online, listening music or playing game ..., he can buy and pay for service on the application interface without closing existing applications.

For the model on website environment, Payment methods are supported by Nganluong.vn such as:

- Phone card
- Bank account
- Nganluong.vn account balance
- Credit card or PayPal account balance

Viewing Nganluong.vn's payment method at appendix1 of this document or the demo as followings link http://sandbox.nganluong.vn/demo

1. Process

Integration is deivded into 2 processes as the following:

2.1. add funds in merchant

On the website, the merchant only need to set up a button "add funds", the customer could choose method of adding funds into Nganluong.vn account. Then, Nganluong.vn will notify the information of the transaction and update money into NganLuong.vn account of the customer. By this way, the merchant does not need to fix the money in advance (on the interface of the website)

- Methods of adding funds supported by Nganluong.vn
 - Using Nganluong.vn account balance
 - Using phone card code (Mobifone, vinaphone, viettel...)
 - Using domestic bank account.
 - Using PayPal account balance.
- Adding funds process

Step 1: Customer choose the method of adding funds on the website of the merchant.

<u>Step 2</u>: Merchant system sends the request of adding funds transaction on Nganluong.vn's system (called function "SetExpressCheckoutDeposit" in the appendix 05 of this document).Nganluong.vn will return the merchant a link to open a window for choosing the methods of adding funds supported by Nganluong.vn on the interface screen of the merchant's website (This window is created by simple javascript code provided by Nganluong.vn)

<u>Step 3</u>: The customer choose the method of adding funds in the formn provided by Nganluong.vn. (4 methods above), enter money and do the process.

Step 4: After adding funds successfully, Nganluong.vn will redirect user back the website of the merchant as return_url parameter sent to Nganluong.vn by the merchant at step 2.

<u>Step 5</u>: Merchant's system will process for checking the result returned on the website of return_url parameter to get the information of the transaction and the money added then provides the service to customer as the money added.(example: adding virtual money into customer's account on the website of the merchant). After finishing, the merchant notify the result to the customer (example: viewing successful transaction on screen)

2.2. Paying for product, service with default money of the merchant

Merchant will ask the customer for choosing the product to calculate price that the customer has to pay or enter money in the form of the merchant in advance. After that, the merchant will send the information of payment (include price) to Nganluong.vn in order that the customer could pay.

- Payment methods supported by Nganluong.vn
 - Nganluong.vn account Balance
 - Domestic Bank account
 - PayPal account Balance
 - Credit and debit card through PayPal
- payment process

<u>Step 1</u>: Customer choose product and service on the website, then click the button "pay" through NganLuong.vn

<u>Step 2</u>:Merchant's system send request about transaction on Nganluong.vn's system (call function SetExpressCheckoutDeposit in appendix 05 of this document).Nganluong.vn will return a link for merchant to open a windown with methods add funds which Nganluong.vn supported into screen of merchant (This windown's created by javascript code, provided by Nganluong.vn)

Step 3: Buyer choice Payment methods and process payment

Step 4: After paying successfully, Nganluong.vn will redirect user back to website of merchant follow return_url parameter that merchant send to Nganluong.vn at step 2.

<u>Step 5</u>: Merchant's system will process checking the result returned on the website which has contained return_url parameter to get the transaction information and update the invoice or provide service to customer as money added.(for example: add virtual money into customer's account on the website of the merchant). After providing the service, the merchant will notify the result to customer (for example: viewing the successful transaction on the screen).

2. Connection model

The communication between merchant's system and Nganluong.vn is processed through SOAP protocol(webservice) . Webservice address as the following:

- On sandbox environment: http://beta.nganluong.vn/micro_checkout_api.php?wsdl
- On live environment: https://www.nganluong.vn/micro_checkout_api.php?wsdl

3. Integration

Step 1: Registing account and setup (service config)

- For integrating, you need to register an account to receive money on Nganluong.vn (register here or view guide) and get verified account (view guide)
- Setup integrating digital goods of Nganluong.vn (view appendix 02)
- If you receive money through PayPal or international credit cards through PayPal, you need to register and get verified a PayPal account (register <u>here</u>) and setup to integrate digital goods (view appendix 03)

Step 2: Register your website on Nganluong.vn

If your website has not been registered on Nganluong.vn yet, you pleased follow up the guide at appendix 04 of this document.

Result of this step, you need to have 2 things:

- website's code that you registered on Nganluong.vn (this code provided by Nganluong.vn automatically)
- Communication password between your website and Nganluong.vn

Step 3: Integrating payment function into your website

This step will use 2 functions: SetExpressCheckoutDeposit or SetExpressCheckoutPayment of Nganluong.vn, these functions are described in appendix 05

For example:

At the button "Mua ngay", you set up the code as the following:

```
<imgsrc="http://nganluong.vn/data/images/buttons/8.gif" id="btn_payment">
    <script src="http://data.nganluong.vn/javascripts/nganluong.apps.mcflow.js"
language="javascript"></script>
    <script language="javascript">
        var mc_flow = new NGANLUONG.apps.MCFlow({trigger:'btn_payment',url:'URL'});</script>
```

For above URL, you use function SetExpressCheckoutPayment to send parameters to Nganluong.vn, Nganluong.vn will return you a payment link to put in this URL.

If you don't use payment button, you want your customer to add funds and money is added on Nganluong.vn, you need to use the function SetExpressCheckoutDeposit to send parameters to Nganluong.vn

Returned link is like this:

https://www.nganluong.vn/micro_checkout.php?token=5176cbc0996f1f209a1fdb05386b65b3c4a

If your website accepts one of the methods of Nganluong.vn or you let your customer choose the method of immediate payment on your form, while putting a link (URL above), in the result returned by Nganluong.vn, you add parameter Payment_option on the payment link (for example: https://www.nganluong.vn/micro_checkout.php?token=517-

6cbc0996f1f209a1fdb05386b65b3c4a&payment_option=nganluong). Then on payment form of Nganluong.vn only display correlative payment method.

Values of Payment_option:

Value	Explaination
Nganluong	Only displaying payment method through Nganluong.vn balance on the payment form (form popup)
Bank	Only displaying payment method by Domestic Bank account on the payment form of Nganluong.vn(form Popup)
Mobile	Only displaying payment method by phone card on the payment form of Nganluong.vn (form popup)
Paypal	Only display payment method by international credit card or paypal account balance on payment form of Nganluong.vn (form popup)

Step 4: Update transaction status while finishing payment

When paying successfully, Nganluong.vn will take customer back to your website as the return_url parameter that you sent to request arising payment transaction by SetExpressCheckoutPayment or SetExpressCheckoutDeposit

On returned parameter, Nganluong.vn returns you token parameter that is the value of token sent to Nganluong.vn to pay (returned from the function SetExpressCheckoutPayment or SetExpressCheckoutDeposit)

For example:

http://sandbox.nganluong.vn/demo/update_order.php?token=517-6cbc0996f1f209a1fdb05386b65b3c4a

On this link, You could perform in correlative file

<u>Step 4.1</u>. Checking the status of transaction by calling the function GetExpressCheckout in API of Nganluong.vn with the token code you received (viewing the explanation of function in appendix 05). If

transaction does not exist or has not finished yet (unpaid) then it will be notified the error on the screen. If transaction is successful, then move to step 4.2

Step 4.2: Process on your website as the following:

- Update paid invoices
- Update account balance (virtual) of the customer on your website.
- Send email to customer as the notification

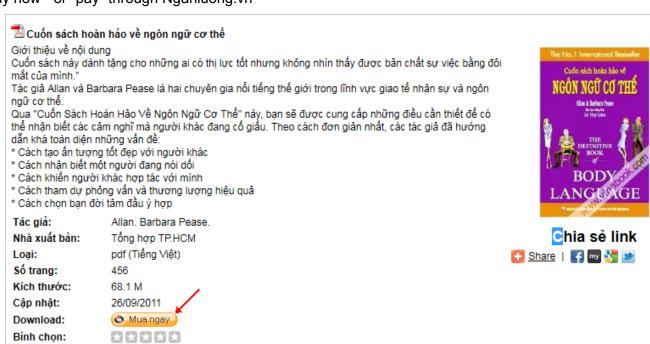

-

And notice the finished transaction on the screen.

Appendix 01: Describing the payment process

Payment process as the following steps:

<u>Step 1</u>: the customer chooses the product, service which they want to buy, then click the button "buy now" or "pay" through Nganluong.vn

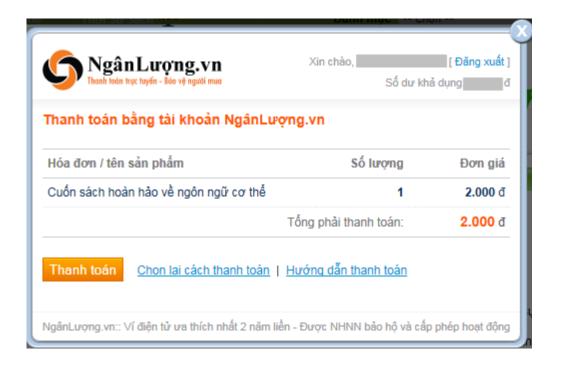

Step 2: Choosing the payment method

Option 1: Paying by Nganluong account balance

Option 2: paying online by domestic bank account

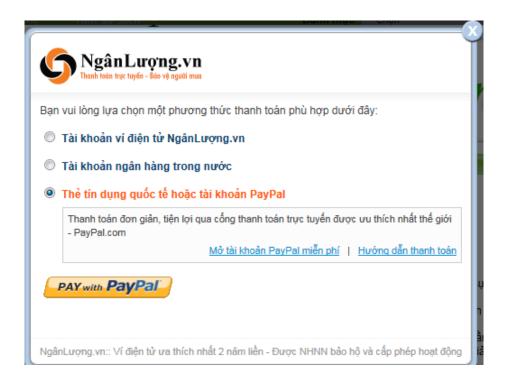

Ngân Lượng. vn Thanh toán trực tuyến - Báo vệ người mua	Xin chào, Số dư khá	[Đăng xuất] à dụng đ
Thanh toán bằng tài khoản ngân hả	ang Vietcombank	
Hóa đơn / tên sản phẩm	Số lượng	Đơn giá
Cuốn sách hoàn hảo về ngôn ngữ cơ thể	1	2.000 đ
	Tổng phải thanh toán:	2.000 đ
Hấy nhập địa chỉ Email và số điện thoại của * Email: * Điện thoại: * Mã bảo mật: Thanh toán »	Chon lai cách thanh toán	
Lưu ý: Tài khoản NH của bạn cần đăng ký và k SMS-Banking trước khi thực hiện thanh toán (x NgânLượng.vn:: Ví điện tử ưa thích nhất 2 năm	em hướng dẫn <u>tai đây)</u>	

Option 3: Paying by Paypal account or international credit card

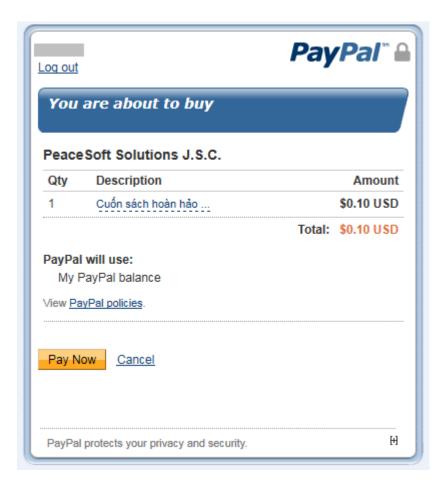

Appendix 02: Choosing digital goods on Nganluong.vn

- Log in Ngaluong.vn account
- Choosing the section "account information", clicking "account config" or clicking the following link to get the config:

https://www.nganluong.vn/?portal=nganluong&page=user_setup

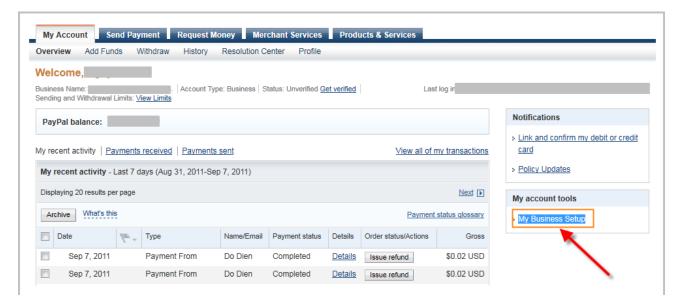

- clicking the option "sell digital goods" then set up the config (if you use connecting through Paypal, you have to enter 3 information: API username, API Password, signature in the configuration of account). Nganluong.vn configuration form as the following:

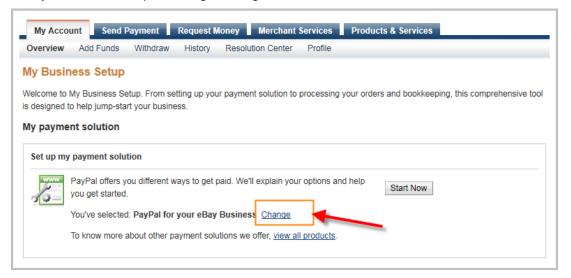

Appendix 03: Choosing digital goods on PayPal.com

- Login PayPal account at http://paypal.com
- At Overview page, clicking "My Business Setup"

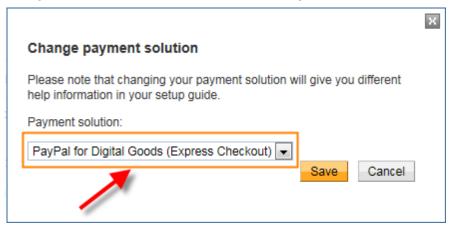

At my buniness setup, clicking "Change"

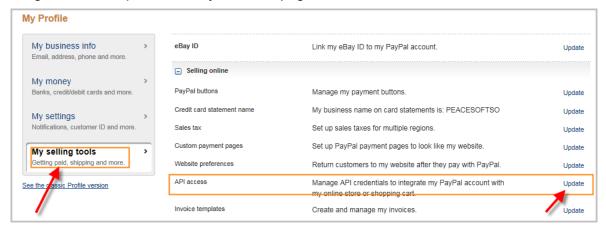

- Clicking "PayPal for Digital Goods (Express Checkout)", clicking "save"

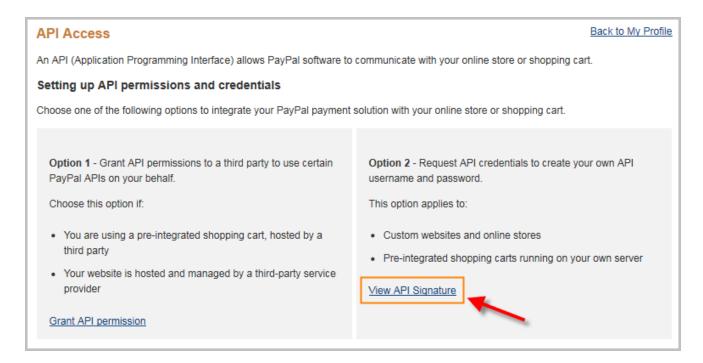

- Choosing the section "profile" at "my account" page

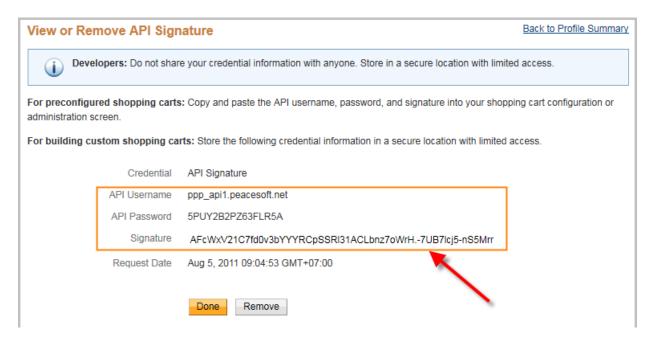

- At API access, choosing "view API signature"

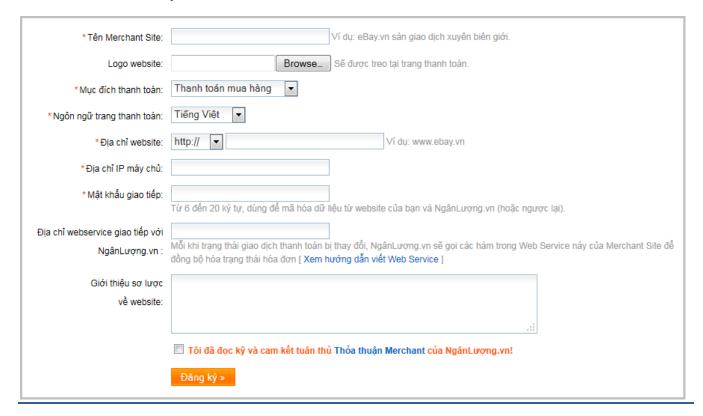

Getting connection information to save in configuration of the digital goods of Nganluong.vn

Appendix 04: Register website to integrate on Nganluong.vn

- Log in Ngaluong.vn account as link https://www.nganluong.vn
- Clicking menu "integrate", clicking "integrate website B2C", clicking "register merchant site" (Register website)
- Enter information as the form below, click "register" to add your website
- After registering, you need to upload verification file on hosting where filled the registered website address, click "verify" to finish.

Appendix 05: Describe connection function

Arising function of add funds transaction: SetExpressCheckoutDeposit

input parameter			
name of parameter	Kind of data	Description	
merchant_site_code	Int(11)	Merchant site code (Nganluong.vn will provide when registering website)	
params	String()	Be a string of parameters that is configured as XML structure	
receiver	String(255)	Email address of Nganluong.vn account used to receive money	
order_code	String(50)	invoice code (unique) which merchant arises, use to automatically update status(for example: add virtual money on the wwebsite of merchant) when NganLuong.vn returns the result	
return_url	String(500)	URL address, Nganluong.vn returns the result when making "add funds transaction" successfully	
cancel_url	String(500)	URL address, Nganluong.vn returns the result when customer denies adding funds.	
language	String(4)	Display language on the interface of Nganluong.vn, have one of 2 following values: VN: Vietnamese EN: English	
example for parameter			
params = " <params></params>			
<receiver>diendc@nganluong.vn</receiver>			
<language>vn></language>			
<return_url>http://sandbox.nganluong.vn/demo/update_order.php</return_url>			
<pre><cancel_url>http://sandbox.nganluong.vn/demo/cancel_order.php</cancel_url> "</pre>			
checksum	String(50)	Code to check valid while accessing API of	
	name of parameter merchant_site_code params receiver order_code return_url cancel_url language example for parameter params = " <params></params>	name of parameter Kind of data merchant_site_code Int(11) params String() receiver String(255) order_code String(500) return_url String(500) cancel_url String(500) language String(4) example for parameter params = " <params></params>	

checksum parameter's structure

checksum = MD5(receiver+ order_code+ return_url+ cancel_url+ language +communication password when register website in Nganluong.vn).

EX: Checksum was made by PHP language

\$receiver = "diendc@nganluong.vn";

\$order code = "24785324";

\$return_url = "http://sandbox.nganluong.vn/demo/update_order.php";

\$cancel_url = "http://sandbox.nganluong.vn/demo/cancel_order.php";

\$ language="vn";

\$password = "2e9ee046bba482cc52e5121c3c9958ff";

\$checksum = MD5(\$receiver+\$order_code+\$return_url+\$cancel_url+\$ language

+\$password);

Output parameter

Parameter	Data	Description
result	String()	returned result is a string configured by XML structure, include parameter below
result_code	String(4)	Result returned while calling SetExpressCheckoutPayment function
token	String(70)	Reference code of payment transaction (this code will be used during payment process of nganluong.vn)
link_checkout	String(255)	This is paymentURL (will include in javascript to turn on popup)
time_limit	String(19)	Expiry time is correlative with a token (dd/mm/YYYY, HH:ii:ss
result_description	String(500)	Describing error is correlative with value of result_code

[&]quot;<result>

<result code>Mã lỗi</result code>

<result description>Mô tả lỗi</result description>

<token>Mã tham chiếu giao dịch</token>

checkoutDròng link thanh toán (dùng để bật popup)checkout

Description code table of functions

Error Code	Description
00	Successful
01	Arising error but not defined in error table (unknown error.)
02	Merchant sends website code that doesn't exist or website has registered but unverified.
03	IP server address that calls API functions is not exactly while registering website
04	Checksum code isn't right (mostly because MD5 parameter order is wrong or communication password is wrong)
05	Arising transaction requests of merchant does not perform (using for SetExpressCheckoutDeposit and SetExpressCheckoutPayment)
06	Token code does not exist (using for GetExpressCheckout)
07	Token code unpaid.
